

FOCAL HILO

High / Low-level converter (2 channels)

Convert two high-level outputs (speaker) of a car radio in two low-level line outputs for an amplifier and also eliminates parasitic interference.

Automatically generates a remote control of the amplifier power on from the signal detection.

Can be used in passive mode without 12V supply
(In that case the remote output doesn't work)

Technical characteristics

Bandwidth: 10Hz – 140kHz
Signal/noise ratio superior to 100dB
Distortion inferior to 0.01%
Automatic remote output

Advantages

- Separated grounds, less parasitic interference
- You can connect in parallel the Hilo to the speakers while keeping them connected in the case of the use of a subwoofer for example.
